

DATA REPOSITORY ITEM 2004066

APPENDIX DR1: SUPPLEMENTARY INFORMATION TO THE PHYSIOLOGY AND BEHAVIOR OF CHANNID FISHES

Talwar and Jhingran (1992), West et al. (1991), Lee and Ng (1991), Vierke (1978), Sahni and Khare (1977), Berg (1965), Liem (1963), Smith (1945).

APPENDIX DR2: SUPPLEMENTARY INFORMATION TO THE FOSSIL RECORD OF CHANNID FISHES

Sach et al. (2003), Gaudant (2002), Filipov et al. (2000), Böhme (1999), Sach (1999), Gaudant and Reichenbacher (1998), Gaudant (1996), West et al. (1991), Sytchevskaya (1989), Reichenbacher (1988), Gayet (1988), Sahni and Khare (1977), Khare (1976), Brzbohaty (1969), Logatchev et al. (1964)

APPENDIX DR3: SUPPLEMENTARY INFORMATION TO MATERIAL AND METHODS

This study is based on a dataset from my “Lower Vertebrate” database (Böhme and Ilg, 2003; www.wahre-staerke.com, accessed January 2004). The database contains taxonomic, taphonomic, stratigraphic, ecologic, environmental, and geographic information derived from the literature, as well as from my studies of museum material. The dating of European localities is based on small mammal biostratigraphy and magnetostratigraphy, which allows a time resolution between 0.1 and 1 Ma. The dating of most of the Asian and African localities is based on absolute dating methods, mammal biostratigraphy, or regional stratigraphy and has a somewhat coarser time resolution between 0.1 and 3 Ma. Localities which were stratigraphically ambiguous or for which an age could not be determined were excluded.

The recent distribution of snakehead fishes is taken from Jayaram (1999), Lee and Ng (1994), Bonou and Teugels (1985), Vierke (1978), Coad (1978), Berg (1965) and Smith (1945).

The few Iranian and Baluchistan records of channids (Coad, 1978) are excluded from the climate analysis because these records are from intramontane basins (rivers Bampur, Halil, Dasht, Rakshan, Mashkel) for which climate data are not available. Furthermore, the precipitation in these basins depends highly on orography and varies significantly over short distances (Weischet and Endlicher, 2000).

The GIS mapping (Figure 2, and DR1) was plotted with the program ArcView. The source document for the Mean Annual Precipitation data set is Deichmann and Eklundh (1991). An online available ESRI Shape file from the Global Resource Information Database (GRID) was used. Paleolatitude informations are taken from Dercourt et al., 2000.

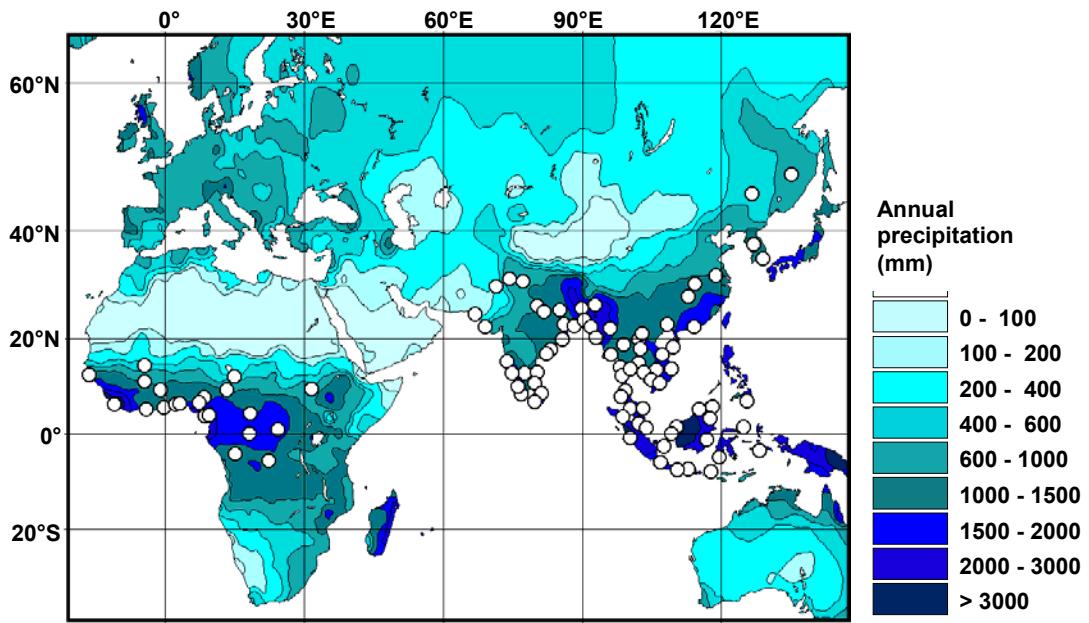

Figure DR1. Annual precipitation map of Old World (data from Deichmann and Eklundh, 1991) and extant distribution of snakeheads (Channidae) indicated by 96 selected climate stations (white dots; see Table DR2 for the data).

APPENDIX DR4: INFLUENCE OF TEMPERATURE ON THE SNAKEHEAD FISH DISTRIBUTION

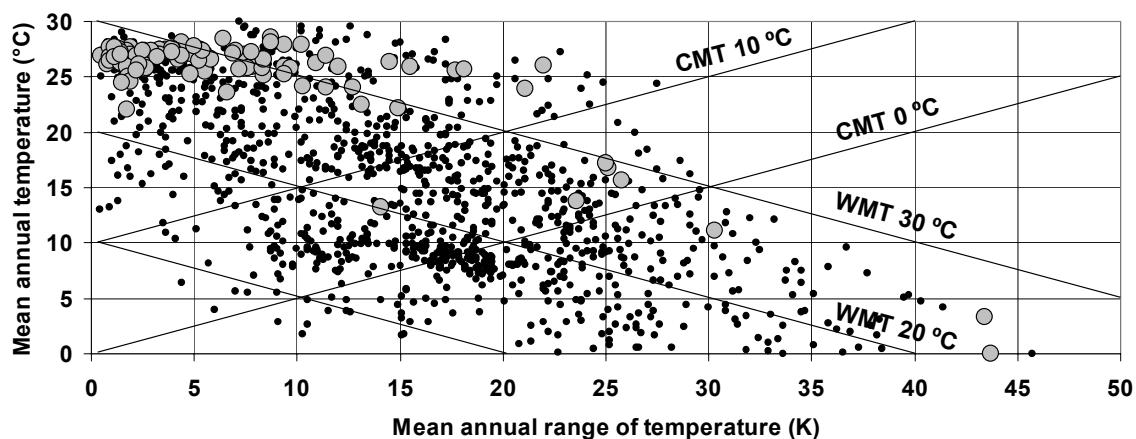

Figure DR2. Distribution of extant snakeheads in a mean annual temperature (MAT) vs. mean annual range of temperature (MART) climate space of 1266 climate stations. Climate data from M.J. Müller and D. Hennings The Global Climate Data Atlas, Climate 1 (www.climate-one.de, accessed January 2004). Small black dots—climate stations without snakeheads ($n = 1170$); large gray dots—climate stations with snakeheads ($n = 96$). WMT—warm-month temperature, CMT—cold-month temperature.

In order to examine the influence of temperature on the snakehead fish distribution, I plotted mean annual temperature (MAT) vs. mean annual range of temperature (MART) (Figure DR2). On the basis of the geometry of the MAT vs. MART climate space occupied by snakeheads, their distribution seems limited by warm-month temperature (WMT) rather than cold-month temperature (CMT), MAT, or MART. This correlation is reflected by the presence of at least one species in the continental, temperate regions of East Asia (Amur Basin of North China)—*Channa argus*.
